

APRICOT 2019
APNIC 47

2nd APNIC Hackathon

ceROVe

(Outsource BGP ROV Feature)

Aris Cahyadi Risdianto
Kensly Joses
Sudhatma Karki

Hackathon Group

Aris Cahyadi Risdianto

- Prepare environment
- Combine the Python Codes
- Testing and verification

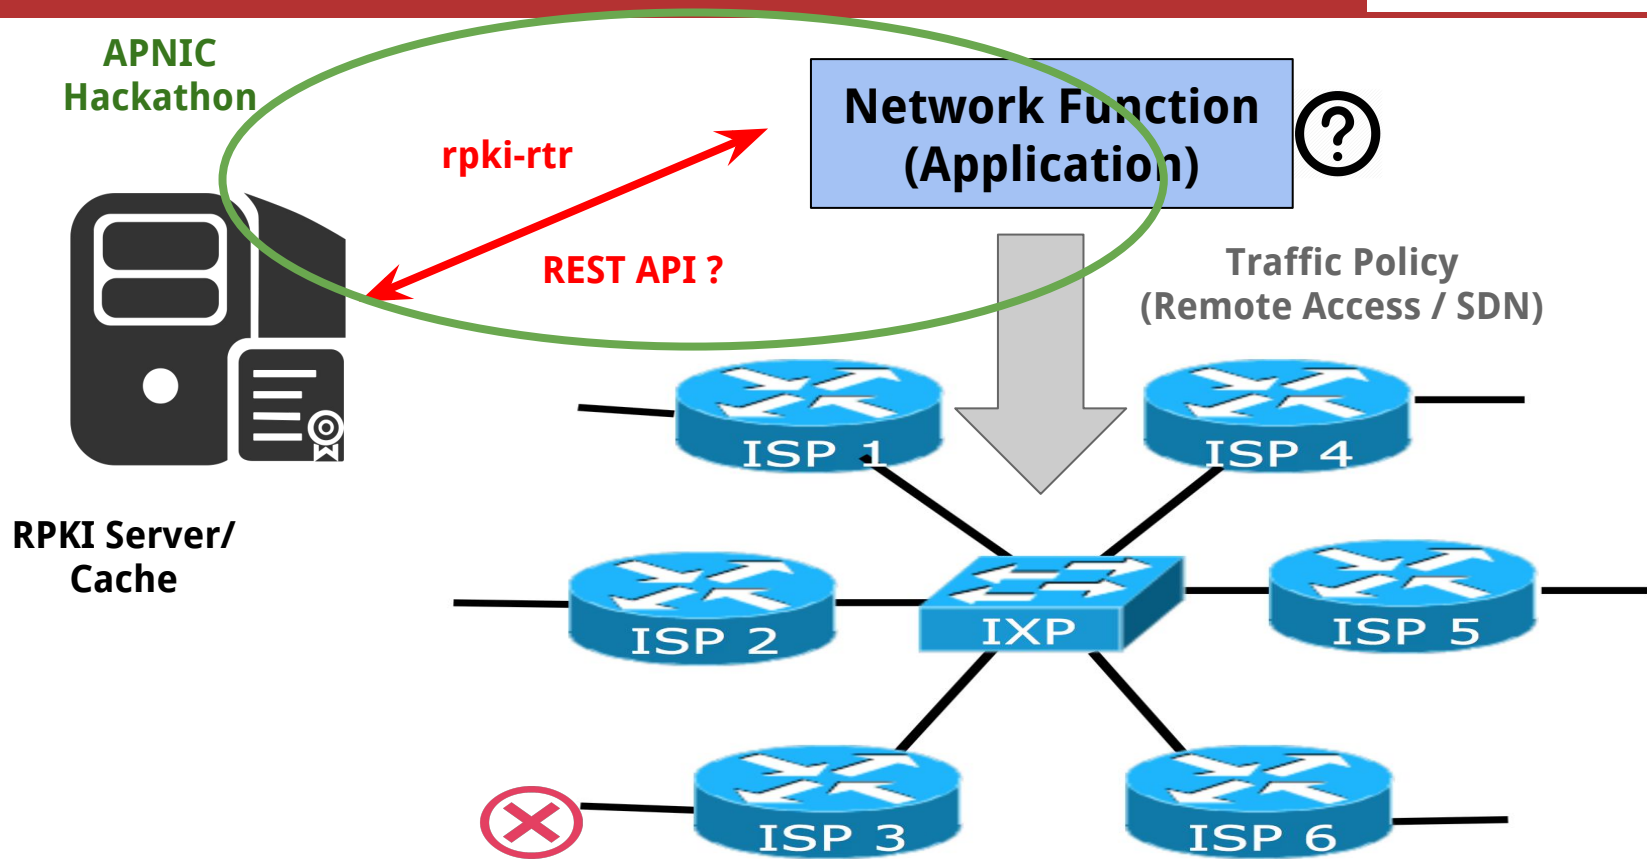

Kensly Joses

- Collecting the ROAs data
- Processing JSON data with Python

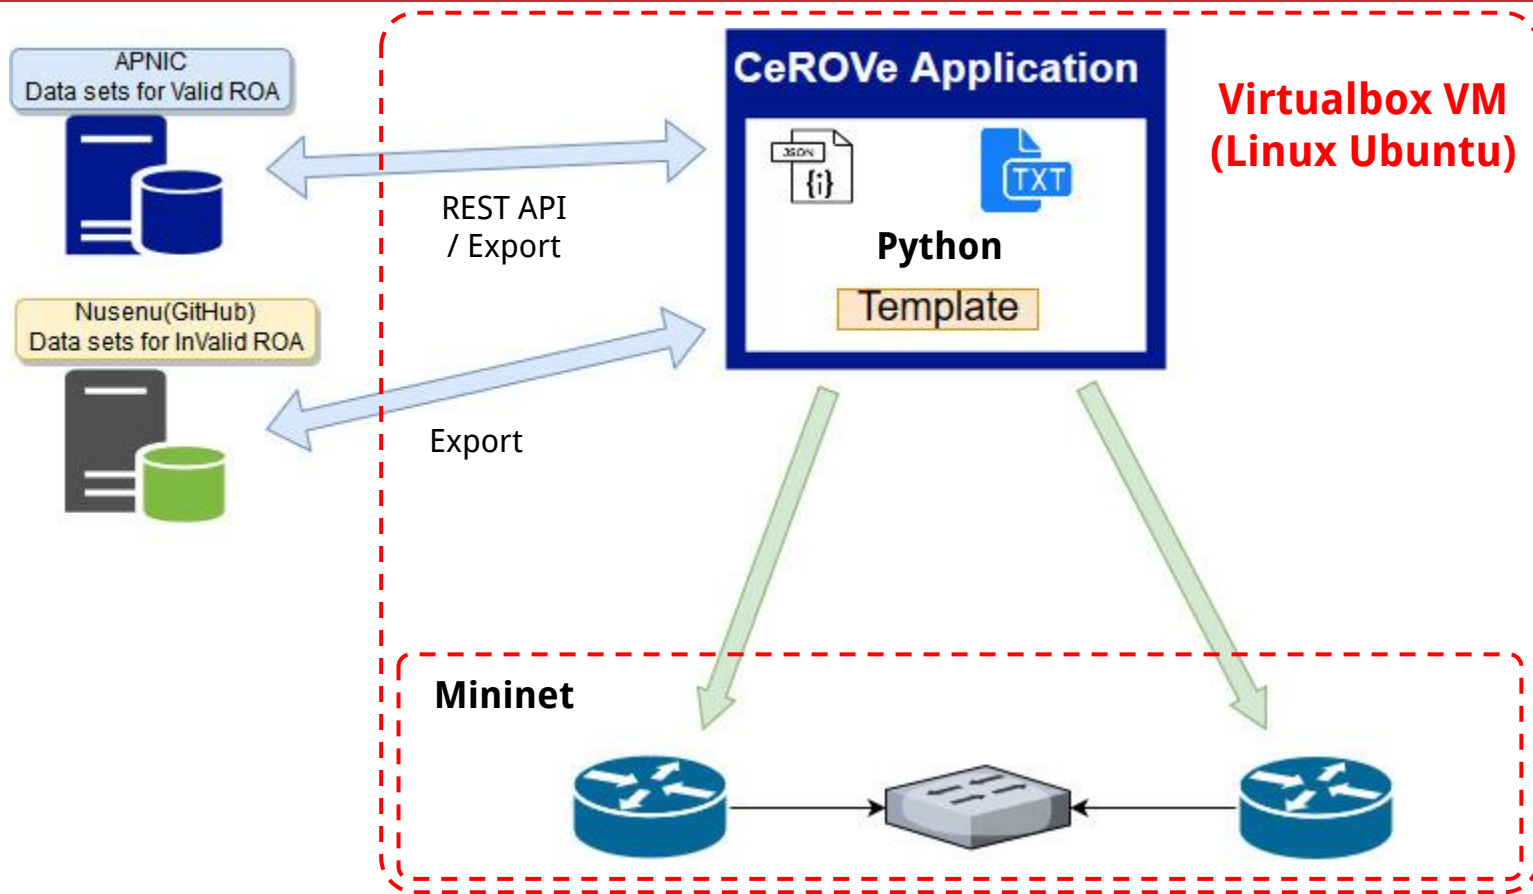

Sudhatma Karki

- Decide the actions for different ROAs
- Managing the hackathon progress work

Outsourced Route Validation

Hackathon Setup

- Getting data from the API's
 - George help us get ROA datasets from APNIC for the valid ROAs
 - And data sets for invalid ROAs from Nusenu (Github)
- Python coding challenges
 - Do research and sharing ideas on the coding helps get the program running successfully
 - Spaces, characters and alignment cause a big problem
- Virtual Environment
 - It is good, but don't expect about performance
 - Display problem and copy paste issue
 - We can't push the config to the software-based virtual router

Demo

1. [Route Origin Validation for Valid ROAs](#)
2. [Route Origin Validation for Invalid ROAs](#)
3. [Route Origin Validation for Unknown ROAs](#)

Conclusions

- It is possible to make a simple program to outsource the ROV from the router
- With the application it is easier to query to many different Trust Anchor for different ROA's state
- As future work:
 - Use online REST API call (if reliable)
 - Push the config to the HW router/switch

THANK YOU !!!
